16. Abstracts The Environmental Protection Agency (EPA) operated the National Aerometric Data Bank for the storage, summary, and retrieval of aerometric data. Data are submitted to EPA from local, state, and Federal air pollution control agencies as well as a limited number of private institutions. Prior to the submission of any ambient air data, the participating agency must supply EPA with specific information related to the sampling site and its environment. It is imperative that this site information be complete and accurate for the proper interpretation and analysis of the aerometric data contained in the data bank. This publication included a listing of all monitoring sites which have submitted a SAROAD (Storage and Retrieval of Aerometric Data) Site Identification Form. The SAROAD site code identifies the sampling site location and is assigned by EPA. It identifies the: state; county, parish or air pollution district in the state; particular site within the city or county; type agency responsible for the sample analysis; and type of project being conducted at the site. The directory contains a computer listing of all site information currently stored in the National Aerometric Data Bank.

DIRECTORY OF AIR QUALITY MONITORING SITES 1972

INTRODUCTION

The Environmental Protection Agency (EPA) operates the National Aerometric Data Bank for the storage, summary, and retrieval of aerometric data. Data are submitted to EPA from local, state, and Federal air pollution control agencies as well as a limited number of private institutions. Prior to the submission of any ambient air data, the participating agency must supply EPA with specific information related to the sampling site and its environment. It is imperative that this site information be complete and accurate for the proper interpretation and analysis of the aerometric data contained in the data bank.

This publication includes a listing of all monitoring sites which have submitted a SAROAD (Storage and Retrieval of Aerometric Data) Site Identification Form (Figures 1 and 2). The following paragraphs and tables describe the various identifying codes used to characterize the site information.

The most important code used in the data bank is the unique 12-digit SAROAD site code. This code, based on the sampling site location, is assigned by EPA. The first two digits of the site code identify the state code, which has been assigned sequentially to an alphabetic listing of state names. For consistency, the District of Columbia, Puerto Rico, Guam, and American Samoa have also been assigned codes. (Codes for Guam and American Samoa were not assigned alphabetically.) The next four digits of the site code identify the city, county, parish, or air pollution control district within the state. This code is obtained from a publication listing the codes within each state alphabetically for all cities with a population of 2,500 or more, and all counties, parishes, and control districts, regardless of population (APTD-0907, SAROAD Coding Manual). The following three digits identify the particular sampling site within the city or county, and the next letter and two digits identify the type of agency responsible for the sample analysis (Table 1) and the type of project being conducted at the site (Table 2).

It is important to note that this 12-digit site code assigned by EPA is used to identify data being submitted from the sampling site, and cannot be changed in any manner without prior notification by EPA.

Following this introduction is a computer listing of all the site information currently stored in the National Aerometric Data Bank. It should be emphasized that a directory of this nature requires constant revision. Corrections and additions to this information will be made as necessary, and updates to this directory will be published regularly to permit timely interpretation of the aerometric data stored in the National Aerometric Data Bank.
